EDUCATION

University of Waterloo

Waterloo, ON

Bachelor of Computer Science, Honours Co-op

Sep. 2025 – May. 2030

- Scholarships & Awards: UW International Student Scholarship & President's Scholarship of Distinction

SKILLS

Languages: Python, C, Java, JavaScript, TypeScript, SQL

Frameworks: React, Next.js, FastAPI, Node.js, Bootstrap

Tools: PostgreSQL, Prisma, Supabase, Git, Google Cloud, Azure

Libraries: PyTorch, scikit-learn, TensorFlow, MediaPipe, Pandas, Matplotlib, OpenCV

PROJECTS

COAT | *Python, FastAPI, React, PostgreSQL, Supabase, scikit-learn*

2026

- Built a full-stack job-tracking platform with Gmail and Outlook OAuth 2.0 integration to auto-scan emails, classify application activity, and auto-schedule calendar events — no manual inbox triage.
- Trained a TF-IDF + Logistic Regression classifier on ~1,200 labelled emails, achieving 94% cross-validated accuracy across five application-stage categories.
- Developed a regex fallback for low-confidence predictions to capture edge cases and eliminate silent misclassifications.
- Engineered a collaborative-filtering recommendation engine (Matrix Factorization + Cosine Similarity) surfacing personalised job listings from anonymised peer interview outcomes — bootstraps cold-start users from cohort-level signal rather than individual history.
- Designed a PostgreSQL schema on Supabase to persist user pipelines, status history, and OAuth tokens across multi-session Gmail and Outlook accounts.

MacroLens | *Next.js, TypeScript, PostgreSQL, Prisma, Claude API*

2026

- Built a full-stack nutrition tracker integrating the USDA food database and Open Food Facts via client-side barcode scanning — instant macro breakdowns for packaged and whole foods.
- Developed a PostgreSQL caching layer that serves repeat food lookups directly from the database instead of re-querying the USDA and Open Food Facts APIs on every request.
- Streamed real-time AI nutrition suggestions progressively using the Vercel AI SDK and Claude API as users log meals.
- Designed a Prisma-managed PostgreSQL schema to handle concurrent session writes and prevent database race conditions.

SignSpeak | *Python, MediaPipe Model Maker, TensorFlow, OpenCV*

2024

- Developed a real-time ISL gesture-to-speech pipeline by fine-tuning a MediaPipe hand landmark model on a self-curated dataset of 10,700+ images across 33 gesture classes.
- Engineered a 10-frame majority-vote smoothing filter over raw model outputs to eliminate prediction jitter during continuous hand motion.
- Implemented a background thread to detect 1.5s gesture pauses and infer word boundaries, triggering TTS output only on complete sign sequences.
- Iterated data collection across varied lighting conditions and hand sizes to improve generalisation across real-world inputs.

Netflix Ratings Chrome Extension | *JavaScript, Chrome Extensions MV3, OMDb API*

2026

- Built a Manifest V3 Chrome extension that injects live IMDb and Rotten Tomatoes ratings onto Netflix title cards via an OMDb API background service worker.
- Implemented a MutationObserver to re-inject ratings during SPA navigation, handling dynamic DOM updates without page reloads.

EXPERIENCE

UWDJ — University of Waterloo DJ Club

Waterloo, ON

Executive

May 2026 – Aug. 2026

- Organized weekly DJ sessions for 100+ members and coordinated end-of-term showcases, handling logistics, equipment setup, and event promotion.

Welham Girls' School — Embark Internship Program

Dehradun, India

IT Department Intern

Feb. 2024 – May. 2024

- Shadowed IT department during rollout of a facial recognition-based employee clock-in system, prompting an independent exploration of the underlying face detection/recognition approach.
- Built a 3-stage Python/OpenCV pipeline — webcam-based dataset capture (up to 500 labelled images per identity), Haar cascade face detection, and an LBPH-trained recognizer for real-time identification with confidence-threshold gating.
