EDUCATION

University of Waterloo

Waterloo, ON

Bachelor of Computer Science, Honours Co-op

Sep. 2025 – May 2030

- Scholarships & Awards: President's Scholarship of Distinction (awarded for a 95%+ admission average); International Student Entrance Scholarship

SKILLS

Languages: Python, C, Java, JavaScript, TypeScript, SQL

Frameworks: React, Next.js, FastAPI, Node.js, Bootstrap

Tools: Prisma, Supabase, Google Cloud, Azure

Libraries: scikit-learn, TensorFlow, PyTorch, Pandas, Matplotlib, OpenCV

PROJECTS

COAT | *Python, FastAPI, React, PostgreSQL, Supabase, scikit-learn*

2026

- Built a full-stack job-application tracker with Gmail and Outlook (Microsoft Graph) OAuth 2.0 integration that auto-scans inboxes and sorts each email into application stages (applied, interview, offer, rejection).
- Built a multi-stage classification pipeline — rule-based sender/subject noise filters, a TF-IDF + logistic-regression model, and a keyword fallback — with a **70%**-confidence reject option that defers low-confidence cases to rules rather than forcing a label.
- Benchmarked on held-out emails at **92%** accuracy separating rejections from acknowledgements (**0.87** F1 on rejections vs a **72%** majority-class baseline).
- Built an interview-likelihood ranker using user-based collaborative filtering, blending a company-wide base rate with a peer-similarity signal (**70/30**) and applying Laplace smoothing so cold-start companies with no prior data stay well-defined.
- Designed a PostgreSQL schema on Supabase to persist application pipelines, per-email logs, and OAuth refresh tokens across multiple Gmail and Outlook accounts.

MacroLens | *Next.js, TypeScript, PostgreSQL, Prisma, Claude API*

2026

- Built a full-stack nutrition tracker integrating the USDA food database and Open Food Facts via client-side barcode scanning for macro breakdowns of packaged and whole foods.
- Implemented a PostgreSQL cache-aside layer for barcode lookups, checking the database before falling back to the Open Food Facts API.
- Implemented progressive streaming of AI nutrition suggestions using the Vercel AI SDK and Claude API.
- Designed a Prisma-managed PostgreSQL schema to handle concurrent session writes and prevent database race conditions.

SignSpeak | *Python, MediaPipe Model Maker, TensorFlow, OpenCV*

2024

- Built a real-time Indian Sign Language fingerspelling recognizer by training a MediaPipe gesture model on a self-curated dataset of **10,700+** images across **33** classes, transcribing recognized signs into live on-screen text.
- Ran a MediaPipe-based hand-landmark inference loop over live webcam frames using OpenCV for real-time capture and annotation.
- Iterated data collection across varied lighting conditions and hand sizes to improve generalisation across inputs.

Netflix Ratings Chrome Extension | *JavaScript, Chrome Extensions MV3, OMDb API*

2026

- Built a Manifest V3 Chrome extension that injects live IMDb and Rotten Tomatoes ratings into Netflix's title-detail panel via an OMDb-backed background service worker.
- Used a MutationObserver to re-inject ratings on single-page-app route changes, handling Netflix's dynamic DOM updates without page reloads.

EXPERIENCE

UWDJ — University of Waterloo DJ Club

Waterloo, ON

Executive

May 2026 – Aug. 2026

- Organized weekly DJ sessions for 100+ members and coordinated end-of-term showcases, handling logistics, equipment setup, and event promotion.

Welham Girls' School — Embark Internship Program

Dehradun, India

IT Department Intern

Feb. 2024 – May 2024

- Shadowed the IT department during rollout of a facial-recognition employee clock-in system, prompting an independent exploration of the underlying face detection/recognition approach.
- Built a 3-stage Python/OpenCV pipeline — webcam dataset capture (up to **500** labelled images per identity), Haar cascade face detection, and an LBPH-trained recognizer for real-time identification with confidence-threshold gating.
